# Safety Information

## Important Safety Information

It is mandatory that these operating instructions be read and understood prior to the vacuum pump installation and start-up.

The SOGEVAC vacuum pumps have been manufactured according to the newest technical standards and safety regulations. If not installed properly or not used as directed, dangerous situations or damages might occur.

Under certain operating conditions, dangerous situations may occur when running the vacuum pump. If this happens, please contact our local office.

The pump must only be operated in the proper condition and under the conditions described in the Operating Instructions. It must be operated and maintained by trained personnel only.

“Trained personnel” for the operation of this pump are

- skilled workers with knowledge in the fields of mechanics, electrical engineering and vacuum technology and
- personnel specially trained for the operation of vacuum pumps.

Indicate procedures that must be strictly observed to prevent hazards to persons.

Indicate procedures that must be strictly observed to prevent damage to, or destruction of the appliance.

The references to figures, e. g. (2/10) consist of the Fig. No. and the item No. in that order.

We reserve the right to alter the design or any data given in these Operating Instructions.

When working on the pump system, always observe the Operating Instructions. Disconnect the unit from the power supply before starting any work. Take appropriate precautions to ensure that the pump cannot start.

If the pump has pumped hazardous gases, it will be absolutely necessary to determine the nature of the hazard involved and take the appropriate safety precautions.

Observe all safety regulations ! Take adequate safety precautions prior to opening the intake or exhaust port.

If you send a pump to Leybold, indicate whether the pump is free of substances damaging to health or whether it is contaminated. If it is contaminated also indicate the nature of hazard.

For this you must use the form we have prepared for this purpose.

# Safety Information

This form is available from  
[www.leybold.com](http://www.leybold.com) —> Downloads —> Download Documents.

Please attach this form to the pump, or enclose it with it. This Declaration is required to meet the law and to protect our personnel.

Leybold will return any pump received without a "Declaration of Contamination" to the sender's address.

---

**Warning**

---

The pump must be packaged in such a way that it will not be damaged during shipping, and so that no harmful substances can escape from the package.

# Description

## 1 Description

### 1.1 Design and function

The SOGEVAC are single- stage, oil-sealed rotary vane pumps. The anti-suckback valve, gas ballast valve (optional), exhaust filter, oil return circuit and oil cooling oil are integrated functional elements. The pumps are driven by a directly flanged motor.

The rotor mounted eccentrically in the pump cylinder has three vanes which divide the pump chamber into several compartments. The volume of each changes periodically with the rotation of the rotor.

As the rotor rotates, the intake portion of the pumping chamber expands and sucks gas through the intake port. The gas passes through the dirt trap and the open anti-suckback valve and enters the pump chamber. As the rotor rotates further, the vane separates part of the pump chamber from the intake port. This part of the pump chamber is reduced, and the gas is compressed. At slightly above atmospheric pressure the gas is expelled from the chamber via the exhaust valve.

Oil injected into the pump chamber serves to seal, lubricate and cool the pump. The oil entrained with the compressed gas is coarsely trapped in the oil case by deflection. Then fine filtering occurs in the exhaust filter elements. The proportion of oil in the exhaust gas is thus reduced below the visibility threshold (over 99 % entrapment rate).

Oil trapped in the exhaust filters is returned to the inlet chamber via an oil return transfer. To prevent gas flowing at atmospheric pressure from the oil reservoir into the intake port, the oil return line is controlled by a float valve.

The oil cycle is maintained by the pressure difference existing between the oil case (pressure above or equal to atmospheric pressure) and the intake port (pressure below atmospheric pressure). The ball bearings are greased for 30 000 hours.

A fan running on the pump shaft generates the necessary cooling air. The oil cools down through a radiator.

Water cooled pumps with an oil-water heat exchanger and thermostatic valve are also available (as specific variants).

By opening the gas ballast valve, a controlled amount of air so called «gas ballast» is admitted into the pump chamber. This gas ballast prevents condensation (up to the limit of water vapor tolerance specified in the Technical Data) when pumping condensable gases or vapors.

There are different types of gas ballast :

- small gas ballast ( 4 m<sup>3</sup>/h)
- standard gas ballast ( 7.5 m<sup>3</sup>/h)
- large gas ballast ( 15 m<sup>3</sup>/h)
- gas ballast with electromagnetical valve ( 10 m<sup>3</sup>/h) - [See § 2.6.2](#)

On pumps supplied without gas ballast valve, the valve can be retrofitted. The gas ballast flows are indicative and valid at ultimate pressure.

# Description

Unintentional venting of the vacuum chamber as well as oil suckback when shutting down the pump are prevented by the integrated anti suck-back valve .

In applications where an oil suckback must be avoided by all means, it is recommended to install a dedicated valve.

## 1.1.1 Range of use

### Warning

SOGEVAC pumps are designed for pumping of inert gases in the range of rough vacuum, between atmospheric pressure and ultimate pressure of the pump.

SOGEVAC pumps are not designed for pumping of aggressive, corrosive, flammable or explosive gases. By presence of aggressive, flammable, corrosive or explosive gases, contact Leybold Vacuum. These pumps are not designed for working in flammable or explosive environment.

In case of doubt, contact Leybold Vacuum for the ATEX pump range.

### Caution

The pumps are not suitable for pumping liquids or media which contain dust. Corresponding protective measures must be introduced.

In case of doubt, contact Leybold.

Before pumping greater than atmospheric concentrations of oxygen (> 20 %) or other highly reactive gases, the pump must be modified, degreased and a special oil (such as PFPE) must be used

Take adequate safety precautions. Contact Leybold for important safety instructions.

## 1.2 Standard Specification

The pump is supplied with drive motor in ready-to-use condition. It is supplied with mineral oil, which is filled in.

Specific variants are delivered with different oils. In any case, the oil type is indicated on the pump. No warranty claims could be accepted with use of another oil than specified.

The connection ports are blanked off by plastic protective caps.

Take these caps away before turning on the pump.

## 1.7 Lubricants & grease

Unless otherwise specified on the pump, we recommend to run the Sogevac pumps with Leybonol from Leybold Vacuum which meets following requirements and is approved by Leybold Vacuum:

- low vapor pressure, even at high temperatures ;
- flat viscosity curve ;
- minimum water content and absorption ;
- good lubricating properties ;
- resistant to aging under mechanical strain.

If you use a non-approved oil, we cannot guarantee that our pumps will meet their operating specifications (ultimate pressure, pumping speed, noise, operating temperature, etc). However, the warranty is voided only if the nonapproved oil adversely affects the operation or reliability of the pump.

When using other oil brands, employ nondetergent mineral oils of viscosity class ISO VG68 to ISO VG 100.

Use of other special-grade lubricants for specific applications is possible. Please consult us.

Only use lubricants and grease which have been fully qualified by Leybold.

Pump oil	Ref. No
5 liters mineral oil	L13005
20 liters mineral oil	L13020
200 liters mineral oil	L13099
20 liters Food grade oil	L15020

---

**Caution**

---

**Caution****1.8 Manipulation and stock**

Pumps which have been filled with operating agent must only be moved in the upright position (horizontally). The angle of slope may not be over 10° max. Otherwise oil may escape. Avoid any other orientations during transportation.

**Warning**

Check the pump for the presence of any oil leaks, because there is the danger that someone may slip on the oil which has leaked from the pump. Only use the lifting lugs which are provided on the pump to lift the pump with the specified lifting devices.

Until the pump is put back into service again, the pump should be stored in a dry place, preferably at room temperature (20 °C) but not below 0°C. Before taking the pump out of service, it should be properly disconnected from the vacuum system, purged with dry nitrogen and oil should be exchanged too. The inlet and exhaust ports of the pump must be blanked off using the shipping seals which are included upon delivery of the pump. The gas ballast must be closed and if the pump is to be shelved for a longer period of time it should be sealed in a plastic bag together with a desiccant (Silicagel).

If the pump has been shelved for more than one year, standard maintenance must be run and oil must be exchanged too before the pump is put into service again. We recommend that you contact the service from Leybold.

## 2 Operation

**2.1 Installation**

It is essential to observe the following instructions step by step to ensure a safe start-up. Start-up may only be conducted by trained specialists.

---

**Caution**

The SOGEVACs can be set up on any flat, horizontal surface. Under the four feet, there are metric threaded holes for securing the pump.

The oil level cannot be read properly if the pump is tilted. Pump risks to run dry. The ambient temperature should be between 12°C (55°F) and 40°C (104°F) depending on oil type. By modifying the pump or changing the oil type, the pump can be run at a lower ambient temperature. Please consult us about this.

To ensure adequate cooling of the pump, leave enough space at the air intake and exhaust points, so as for access and maintenance. Make sure to keep the air intake of motor clear.

Do not step on the pump.

## 2.2 Connection to system

The standard pump is not suitable for installation in explosion hazard areas. Please contact us, when you are planning such an application. Before installing the pump you must reliably disconnect it from the electrical power supply and prevent the pump from running up inadvertently. The pump must only be installed by suitably qualified and trained personnel.

Observe all safety regulations.

### 2.2.1 Intake Side

The pump has an internally-threaded intake flange. Using suitable connecting elements (see Fig. 3 and Section 1.4), the pump can be connected to the vacuum system. The cross-section of the intake line should be at least the same as the intake port. If the intake line is too narrow, it reduces the pumping speed. We recommend to apply either LOCTITE or TEFLON tape to the screwed unions so that they are vacuum-tight (especially if gases are dangerous).

- Pump should be connected to inlet line without any tension. Use flex lines or pipe unions in your inlet and exhaust lines so that they can be easily removed for pump maintenance.
- The maximum pressure at the inlet may not exceed atmospheric pressure (about 1013 mbar). Never operate the pump in the presence of over pressures at its intake.
- Type of materials used for mounting of canalisations should take care of pumped gases. It is the same for its tightness.

If the process gas contains dust or particles, it is absolutely essential to install a dust filter in addition to the dust trap supplied (see Section 1.4). We recommend to install the dust filter horizontally using the T-piece (3/13) or the elbow (3/14). This ensures that when removing the filter, no particle falls into the intake port.

You have a choice of four cartridges for the optional inlet filters. The metal cartridge prevents solid particles such as paper or plastics from entering the pump ; the paper and polyester cartridges remove small particles such as dust and powder down to one micron ; the activated carbon cartridge absorbs chemical vapors of acids, solvents, etc. If the carbon cartridge was stored in a damp place, bake it for 2 hours at 212°F (100°C) before use.

When pumping vapors, we recommend to install condensate traps or condensers on the intake side (see Section 1.4).

By pumping of dangerous gases, inlet line must be tight.

No particles or liquids may enter in the pump.

### Warning

## 2.2.2 Exhaust Side

The SOGEVACs have integrated exhaust filters which, even at a high gas throughput, trap the oil mist and guarantee exhaust gas free of oil mist. If the exhaust filters are clogged, pressure relief valve opens and the filters are bypassed. As a result, the proportion of oil in the exhaust gas as well as the pump's oil consumption rise. Installing new exhaust filters will correct this problem. (See Section 3.9)

### Warning

This situation must be resolved by changing the exhaust filters. It is under utiliser's responsibility to assure maintenance on materiel to avoid any trespassement of the limits autorised by regulations.

Check in the individual case whether an exhaust line is necessary and/or prescribed. Volatile substances can pass through the filter. Depending on the processed gas, we recommend to connect an exhaust line ; this is always necessary when the exhaust gases are dangerous.

Observe the safety precautions that apply to your application and process gases. The pump's exhaust port also has an internal thread (ET3/18). A hose can be connected via a suitable screw-in nipple (see Fig. 3 and Section 1.4).

The cross-section of the exhaust line should be at least the same as the pump's exhaust port. If the exhaust line is too narrow, overpressure may occur in the pump.

**The exhaust pipe material must be resistant to pumped gases. Use conductive materials for the exhaust pipe to avoid electrostatic charges.**

Before installing the exhaust line, remove the exhaust-flange plate and ensure that the exhaust demister(s) are secured tightly in place. They sometimes loosen during shipping and installation. A loose demister results in exhaust smoke during start-up and operation.

Install the exhaust line with a downward slope to prevent condensate from flowing back into the pump. If this is not possible, we strongly recommend to install a condensate trap (see Section 1.5). If several pumps are connected to one exhaust line, ensure an adequate cross-section and a non-return valve at the exhaust of each pump.

Never operate the pump with a blocked or restricted exhaust line. Before start-up ensure, that any blinds or similar shut-off devices in the exhaust line on the pressure side are opened and that the exhaust line is not obstructed. Such restrictions reduce the pumping speed, increase the temperature, and could overload the motor or cause a dangerous overpressure in the pump. Excessive pressure in the pump could damage the seals, blow out the sight glass, or destroy the pump housing. In addition to this explosion hazard, excessive backpressure can result in hazardous process gases leaking out of the pump. If you are purging the oil casing with inert gas, limit the inert-gas flow. Contact Leybold for recommendations.

When pumping dangerous gases, the exhaust line must be tight.

### Warning

**The maximum exhaust pressure must not exceed 1,15 bar (absolute). Also reliably prevent the occurrence of any blockage in the exhaust line. Exhaust filter, accessories and the tubing must be rated according to the maximum throughput. The maximum throughput is equivalent to the pumping speed of the pumps.**

## 2.3 Electrical Connections

Ensure that incoming power to the pump is off before wiring the motor or altering the wiring. Electrical connections must be done by a qualified electrician in accordance with the applicable safety regulations.

Wire the motor for the correct supply voltage via connections in the junction box. See the wiring diagram on the motor name plate. For proper connection, a suitable motor protection switch must be used. Set the switch in accordance with the rating on the motor nameplate. The switch should be of class 10 at least.

After connecting the motor and every time you alter the wiring, check the direction of rotation. Observe the direction arrow on the motor hood. During the check, the intake port should be open. If the direction of rotation is wrong, oil may be ejected out the intake port. The vacuum system may be pressurised.

Don't use the motor fan for checking the rotation direction. The motor fan rotates too fast to clearly check during operation ; when it slows during shutdown, it reserves its direction.

Turn off the power supply, and interchange two phases of the connection, if you need to correct the direction of rotation.

We recommend checking the direction of rotation with a phase-sequence indicator.

Prolonged running of the motor in the wrong direction of rotation will damage the pump !

A thermal overload switch is available as an accessory. It cuts out the pump if a specific temperature is exceeded and/or triggers a warning signal.

If any security switch or electrical defect cuts out the pump, re-start-up of the pump is only possible by hand-action.

## 2.4 Water cooling SV320 B

The water cooled SV320 B are built similarly to the SV300 B, but do not have a thermostatic valve. See page 10 for cooling water requirements. Average water consumption is below 300 l/h.

## WATER COOLING CONNECTION SV300 B

# Description

# Operation

## 2.5 Start-up

Oil for the first filling is supplied with the pump.

Before switching on, always make sure that the pump contains enough oil.

The normal oil level is in the middle of sight glass.

If oil has to be added, unscrew the oil-fill plug, add oil and screw the plug firmly back in.

The SOGEVAC is designed for normal startup at temperatures over 0°C (32°F) (as per PNEUROP), depending on used oils.

To avoid overloading the motor, do not start the pump more than six times within one hour. If frequent starts are needed, the pump should run continuously and be linked to the vacuum vessel by means of a valve. In that case, regulation will be made by the valve and not by start/stop of the pump.

With the valve closed, the pump consumes little energy.

- Before starting the pump ensure that the attached accessories meet the requirements of your application and that safe operation is ensured.

- Never expose part of the body to the vacuum. There is a danger of injury. Never operate the pump with an open and thus accessible inlet. Vacuum connections as well as oil filling and oil draining openings must not be opened during operation of the pump.

- The safety regulations which apply to the specific application in each case must be observed. This applies in particular to installation, operation and maintenance (servicing) as well as waste disposal and transportation.

Do not lay the hand on the intake to check vacuum.

Exposure of a part of the body to the vacuum result in a rush of blood in the exposed part.

## 2.6 Operation

The SOGEVAC can pump gases and vapors, provided that the gas ballast valve is installed and open and the pump has reached its operating temperature.

Contact Leybold Vacuum for important safety instructions before pumping greater than atmospheric concentrations of oxygen or other highly reactive gases. The pump must be degreased, modified, and special inert oil must be used for pumping oxygen. Also ATEX variants are available for pumping explosive gases.

The motor manufacturer guarantees a maximum of 6 starts per hour. To avoid exceeding 6 starts per hour, run the pump continuously and regulate the vacuum in your system with a pilot valve.

## Caution

## Warning

## Warning

Pump in operation is hot and some surfaces could reach a temperature higher than 80°C (176°F). There is a risk of burn by touching. Take note of warning labels on the pump.

## **2.6.1 Pumping of Non-condensable Gases**

If the process contains mainly permanent gases, the SOGEVACs can be operated without gas ballast, provided that the saturation vapor pressure at operating temperature is not exceeded during compression.

If you do not know the composition of the gases to be pumped, and if you can't rule out the possibility of condensation, run the pump with gas ballast valve open in accordance with Section 2.5.2.

## **2.6.2 Pumping of Condensable Gases and Vapors. Using gas ballast.**

The pumps with gas ballast valves are delivered with the gas ballast valve open.

The SOGEVAC can be equipped with following types of gas ballasts :

- Standard gas ballast . This gas ballast corresponds to the most important part of applications .
- Gas ballast «big flow» as a variant or accessory is intended for the applications where more vapours of condensable gases could come into the pump.
- Gas ballast "small flow" for pumping on applications where only few vapours are to be pumped and where the ultimate pressure with open gas ballast is important.
- Gasballast with E.M. valve (Cat. No. upon request) This kit is intended for being mounted on pumps on which the gasballast can be driven by an electromagnetic valve applied at 24 VDC.

A gas ballast kit Including all material required for changing the manual gas ballast flow to "small", "standard"or "big" is available: P/N 9 714 64 130

With the gas ballast valve open and at operating temperature, the SOGEVAC's can pump pure water vapor up to the water vapor tolerance indicated in the Technical Data. The pump's water vapor tolerance can be increased by raising the operating temperature.

Use a screwdriver to open the gas ballast valve. The running noise of the pump is slightly louder when the gas ballast valve is open. Before opening the pump to vapors, ensure that the gas ballast valve is open and that the pump has been warmed up for about 30 minutes with closed intake line.

If the gas ballast is connected to an inert gas supply, the pressure of the latter must not be above 1 bar abs.

## Important

Do not open the pump to condensable vapors until it has warmed to operating temperature ; pumping process gas with a cold pump results in vapors condensing in the oil.

For processes with a high proportion of condensable vapors, slowly open the intake line, after reaching the operating temperature to prevent excessive quantities of vapor entering the pump.

One sign of condensation of vapors in the pump is a rise in the oil level during operation of the pump.

During pumping, vapors may dissolve in the oil. This changes the oil properties and causes a risk of corrosion in the pump. Therefore, do not switch off the pump immediately after completion of the process. Instead, allow the pump to continue operating with the gas ballast valve open and the intake line closed until the oil is free of condensed vapors. We strongly recommend operating the pump in this mode for about 30 minutes after completion of the process.

**In cyclic process operation, the pump should not be switched off during the intervals between the individual working phases, but should continue to run with gas ballast valve open and intake port closed (if possible via a valve). Power consumption is minimal when the pump is operating at ultimate pressure.**

**Once all vapors have been pumped off from a process (e.g. during drying), the gas ballast valve can be closed to improve the ultimate pressure.**

### 2.6.3 Working in cycles in / out

We recommend strongly to limit starting of the pump to 5 or 6 per hour. If the process need it, we recommand utilisation of a pneumatic or electromagnetic piloted valve and to let the pump run continuously.

### 2.7 Shutdown

Under normal circumstances, all that you need to do is to switch off the pump. The intake port of the SOGEVAC contains an anti-suckback valve, which closes the intake port when the pump is shut down, thus maintaining the vacuum in the connected system and preventing oil from being sucked back into the system. The valve's functioning is not impaired by gas ballasting, but its cleanliness must be taken care of.

When pumping condensable media, let the pump continue to operate with the gas ballast valve open and the intake line closed before switching off (see Section 2.5.2).

If the pump is to be shut down for an extended period or if the pump has to be stored, proceed as follows: When pumping harmful substances, take adequate safety precautions.

Drain the oil (see Section 3.3). Pour in clean oil up to the bottom edge of the oil-level glass (see Section 3.3) and let the pump run for a few minutes.

## Note

## Warning

Then drain the oil and pour in clean oil up to the top edge of the oil-level glass (see Section 3.3). Seal the connection ports. Special preservation or slushing oils are not necessary.

When the pump has been switched off due to over-heating, initiated by the motor or its protection, the pump must be cooled down to the ambient temperature, and must only be switched on again manually after having eliminated the cause. In order to prevent the pump from running up unexpectedly after a main power failure, the pump must be integrated into the control system in such a way that the pump can only be started by a manually operated switch. This applies equally to emergency cut-off switches.

In case of switching processes in connection with a pump which has warmed up under operating conditions, the pump must then not be directly switched on again.

## 2.8 Pump Ultimate Pressure

If the system cannot reach the pressures specified in the technical date, measure the ultimate pressure directly at the pump's intake port after disconnecting the pump from the system.

The ultimate pressure of non-condensable gases (partial pressure of air) can only be measured with a compression vacuum gauge or a partial pressure gauge. Precise measurements can only be obtained with calibrated instruments.

Upon initial start-up, after prolonged idle periods or after an oil change, it takes a while until the pump reaches the specified ultimate pressure. The pump has to attain its operating temperature, and the pump oil has to be degassed. We recommend operating the pump initially with the gas ballast valve open.

The ultimate pressure depends on the pump temperature and the pump oil used. The best ultimate pressure can be obtained at a low pump temperature and by using the recommended oil types.

### 3 Maintenance

Disconnect the power before disassembling the pump. Make absolutely sure that the pump cannot be accidentally started.

If the pump has pumped harmful substances, ascertain the nature of the hazard and take adequate safety measures.

Observe all safety regulations.

### Service at Leybold's

If you send a pump to Leybold indicate whether the pump is free of substances damaging to health or whether it is contaminated. If it is contaminated also indicate the nature of hazard. For this you must use the form we have prepared for this purpose.

This form is available from  
[www.leybold.com](http://www.leybold.com) —> Downloads —> Download Documents.

Please attach this form to the pump, or enclose it with it. This Declaration is required to meet the law and to protect our personnel.

Leybold will return any pump received without a «Declaration of Contamination» to the sender's address.

The pump must be packaged in such a way that it will not be damaged during shipping, and so that no harmful substances can escape from the package.

If you open a pump at your own works also observe a potential contamination. When disposing of used oil, please observe the relevant environmental regulations. Due to the design concept, SOGEVAC pumps require very little maintenance under normal operating conditions. The work required is described in the sections below.

All work must be done by suitably trained personnel. **Maintenance or repairs carried out incorrectly will affect the life and performance of the pump and may cause problems when filing warranty claims.**

---

### Warning

---

### Warning

# DeMaintenance

## 3.1 Maintenance Schedule

The frequencies stated in the maintenance schedule are approximate values for normal pump operation.

**Unfavourable ambient conditions and/or aggressive media may necessitate more frequent maintenance.**

Maintenance job	Frequency	Section
Check the oil level	daily	3.2.1
Check the oil condition	Depends on process	3.2.2
1st oil change	After 150 h of operation	3.3
Subsequent oil changes	Every 2000 h or 6 months (depending on application)	3.3
Replace the oil filter	At each oil change	3.3
Clean the dirt trap	monthly	3.4
Check the anti-suckback valve	annually	3.5
Radiator cleaning	depends on ambient conditions	3.8
Exhaust filter change	if oil mist at exhaust or annually	3.9
Heat exchanger cleaning	6 months	3.10
Ball bearing exchange	Every 30 000 h	

---

### Caution

To simplify the maintenance work we recommend combining several jobs.

Never mount used seals. Always mount new seals.

Use only genuine Leybold parts.

---

## 3.2 Checking the Oil

### 3.2.1 Oil Level

The pump oil level during operation must always be in the middle of the oil-level glass (ET3/24). When necessary, switch off the pump and add the correct quantity of oil.

High oil consumption often indicates that exhaust filters are clogged (See 3.9).

Stop the pump for filling oil. The oil level should be checked at least once a day

## 3.2.2 Oil Condition

Normally the oil is clear and transparent. If gases or liquids dissolved in the oil result in deterioration of the ultimate pressure, the oil can be degassed by allowing the pump to run for about 30 min. with the intake port closed and the gas ballast valve open.

The amount of oil required for an oil check should be drained via the oil-drain plug (ET3/19) into a beaker or similar container with the pump switched off but still at operating temperature.

Depending on the process involved, dangerous substances may escape from the pump and oil. Take the appropriate precautions.

**Observe the safety regulations.**

---

## Warning

## 3.3 Oil Change, Replacing the Oil Filter

Tool required: oil filter key (710 73 532)

Always change the oil when the pump is switched off but still at working temperature.

If there is a risk of the oil being polymerized by the connected process, change the oil immediately after operation of the pump.

Pump in function is hot and some surfaces could reach a temperature higher than 80 °C (176 °F).

There is a risk of burn by touching.

Unscrew the oil-drain plug and let the used oil drain into a suitable container.

Depending on the process involved, dangerous substances may escape from the pump and oil. Take the appropriate precautions.

**Observe the safety regulations.**

When disposing of used oil please observe the relevant environmental regulations!

When the flow of oil slows down screw the oil-drain plug back in, briefly switch on the pump (max. 10s) and switch it off. Remove the oil-drain plug again and drain the remaining oil.

Unscrew the oil filter. Take a new oil filter, moisten its gasket with oil and screw it in manually.

Reinsert the oil-drain plug (check the O-Ring and replace it with a new one if necessary).

Unscrew the oil-fill plug and fill the pump should be flushed by filling it with fresh oil up to the bottom edge of the oil-level glass, run it for a short time and then change the oil again.

Use suitable oil only (see Section 1.7).

---

## Important

### 3.4 Cleaning the Dirt Trap

Required tools: Allen key male 8 mm. A dirt trap for coarse particles is located in the intake flange of the pump. It should be kept clean to avoid reduction of the pumping speed.

Remove four screws and take off the intake flange and gasket. Remove the retaining ring and support piece from inside. Take out the wire-mesh screen and clean it with a suitable solvent.

Reassemble in the reverse sequence. We recommend replacing the gasket by a new one.

Depending on the process involved, dangerous substances may escape from the pump and oil. Take the appropriate precautions.

#### Observe the safety regulations.

When disposing of used oil, please observe the relevant environmental regulations!

Never mount used seals ; always mount new seals.

### 3.5 Checking the Anti-Suckback Valve

Required tools : Allen key male 8 mm - Adjusting ring: 710 72 333

Keep the anti-suckback valve clean to ensure proper operation of the pump. If the pump is exposed to large amounts of dust or dirt, we strongly recommend to install a dust filter upstream (see Section 1.4).

First disconnect the intake line. Remove four screws and take off the intake flange and gasket. Remove the spring and anti-suckback valve. If the anti-suckback valve closes too soon, carefully compress the spring slightly. The top edge of the valve should be about 1-2 mm away from the bottom side of the intake port.

Depending on the process involved, dangerous substances may escape from the pump and oil. Take the appropriate precautions.

#### Observe the safety regulations.

Never mount used seals ; always mount new seals.

When disposing of used oil, please observe the relevant environmental regulations !

---

#### Warning

#### Caution

#### Important

---

### 3.6 Cleaning the Gas Ballast Intake Filter

Required tools: none

On the big flow gas ballast, the inlet filter must be changed when the GB flow decreases. Filter P/N 710 20 852

### 3.7 Disassembly of electrical motor

Disconnect the power before disassembling the pump. Make absolutely sure that the pump cannot be accidentally started.

1. To disassemble motor from coupling housing, unscrew the 4 hexagonal head screws.
2. With the help of an extractor puller, remove the coupling of the motor shaft after having untightened the locking screw by a male Allen key 4 mm.
3. The reassembly is carried out in the reverse sequence.
4. Check direction of rotation.

---

### Warning

### 3.8 Radiator cleaning

Please keep the oil cooler clean to have an efficient cooling. For that, remove the turbine cover and clean it with compressed air from the turbine inside. Then reassemble the cover.

### 3.9 Exhaust filter exchange

- Remove the screws of the exhaust plate (ET3/18) using a 8 mm Allen key
- Lift the 3 exhaust filters (ET3/25) from the W shaped metal sheet holder and remove them from the oil casing (ET1/1)
- Make sure that the new exhaust filters (ET3/25) have the O-ring (opposite side of overpressure valve) and grease them using vacuum grease
- Replace the O-ring (ET3/26p) of the exhaust plate (ET3/18)
- Insert new exhaust filters (ET3/25). They are guided in the oil casing (ET1/1) correct position. Make sure the compression springs (ET3/27) are behind the W shaped metal sheet holder.
- Plug the exhaust plate (ET3/18) on the W shaped metal sheet holder with the 2 location pins and screw the exhaust plate (ET3/18) on the oil casing (ET1/1) using a 8 mm Allen key.

#### General Remarks

**We reserve the right to alter the design or any data given in these Operating Instructions. The illustrations are not binding.**

## 3.10 Heat exchanger cleaning

Waterdrain if the cooling circuit before transport, long time storage, winter time.

To drain the water circuit, close the water cooling, remove the both plugs item 104 and place a water recovery tray with a capacity of approx. 2L under the heat exchanger.

Water may be hot, take appropriate safety measures.

For putting into operation again, screw the 2 plugs item 104 again into the heat exchanger, and open the water circuit.

To clean the heat exchanger: It is recommended to clean at least twice a year the water circuit.

For that, dismantle the exchanger from the pump.

Chemical cleaning is the most efficient, with dilute hydrochloric acid solution (5 to 10%) then neutralize with hexamethylethylenetetramine at 0,2%.

For a 1 MM coat of scale, leave acting the acid during about 30 min.

The system must be open during the operations, so the product gases can escape.

Rinse copiously with water after neutralization.

Proceed in an open and well ventilated place.

Observe the safety regulations given by the manufacturer of the product you are using.

Observe the regulations for the treatment and the disposal of chemical products.

Observe the relevant environmental regulations.

---

[documentation@leybold.com](mailto:documentation@leybold.com)

This declaration of conformity is issued under the sole responsibility of the manufacturer.

- Product: SOGEVAC, Single Stage Rotary Vane pumps, with motor
- Models: SV300B-320B
- Pump family codes:

*SV300 B 960700Vxxxx to 960718Vxxxx and 10330300Vxx*  
*SV320 B 960722Vxxxx to 960732Vxxxx and 10330320Vxx*

*xx or xxxx are chronologically numbered customer variants*  
*xxxx = 2016 = PFPE prepared pumps for O<sub>2</sub> pumping*  
*xxxx = 2002 = water cooling*

The object of the declaration described above is in conformity with relevant statutory requirements:

Supply of Machinery (Safety) Regulations 2008

*The objectives of the Electrical Equipment (Safety) Regulations 2016 are governed by Annex 1 1.5.1 of this regulation.*

Restriction of the Use of Certain Hazardous Substances in Electrical and Electronic Equipment Regulations 2012

Based on the relevant requirements of harmonised standards:

EN 1012-2:1996 +A1:2009 Compressors and vacuum pumps. Safety requirements. Vacuum pumps

EN 60204-1:2018 Safety of machinery. Electrical equipment of machines. General requirements

This declaration, based on the requirements of the listed Statutory Instruments and EN ISO/IEC 17050-1, covers all product serial numbers from this date on: **2023-04-06**

You must retain the signed legal declaration for future reference

This declaration becomes invalid if modifications are made to the product without prior agreement.

**Signed for and on behalf of / Leybold GmbH**

Andries de BOCK  
VP Engineering  
Industrial Vacuum Division

François BOUILLOT  
General Manager Leybold Valence

This product has been manufactured under a quality management system certified to ISO 9001:2015

## ADDITIONAL LEGISLATION AND COMPLIANCE INFORMATION

EMC (EU, UK): Class A/B Industrial equipment

Caution: This equipment is not intended for use in residential environments and may not provide adequate protection to radio reception in such environments.

RoHS (EU, UK): Material Exemption Information

This product is compliant with the following Exemptions

Annex III:

- 6(a) **Lead** as an alloying element in steel for machining purposes and in galvanised steel containing up to 0.35 % lead by weight
- 6(b) **Lead** as an alloying element in aluminium containing up to 0.4% by weight
- 6(c) Copper alloy containing up to 4% **lead** by weight

REACH (EU, UK)

This product is a complex article which is not designed for intentional substance release. To the best of our knowledge the materials used comply with the requirements of REACH. The product manual provides information and instruction to ensure the safe storage, use, maintenance and disposal of the product including any substance based requirements.

Article 33.1 Declaration (EU, UK)

This product contains Candidate List Substances of Very High Concern above 0.1%ww by article as clarified under the 2015 European Court of Justice ruling in case C-106/14.

- Lead (Pb)  
This substance is present in certain steel / aluminium / brass components.

### Compliance Information – incorporated products and assemblies

Motors Regulation (EU) No 2019/1781 electric motors and variable speed drives

*Based on the requirements of harmonised standard:*

EN 60034-30:2009: Rotating electrical machines -- Part 30: Efficiency classes of single-speed, three-phase, cage-induction motors (IE-code)

Fans 2009/125/EC Ecodesign directive requirements for energy-related products  
Regulation (EU) No 327/2011: Industrial fans driven by motors

### Additional Applicable Requirements

The product is in scope for and complies with the requirements of the following:

2012/19/EU Directive on waste electrical and electronic equipment (WEEE)

This product has been manufactured under a quality management system certified to ISO 9001:2015
